Logotype – file formats

Print

In print media, the use of Adobe Illustrator files (*.ai) is recommended. AI files contain colour profiles that enable optimum reproduction of our Corporate Design colours in an appropriately configured workflow, as opposed to Illustrator EPS file formats.

Digital

The use of PNG and SVG files is recommended for digital applications. JPGs are also possible. Because a JPEG is never transparent, there is no appropriate file format for the white logo version.

Colour designations

SC: Spot Colour/Special Colour (e.g. Pantone, HKS)

CMYK_PSOCoatedV3: Cyan Magenta Yellow Black (PSOcoatedV3 Fogra51 is a printing standard for sheet-fed offset printing on coated paper)

Black/White: Monochrome

sRGB: Red Green Blue (sRGB IEC61699-2.1 is a standardized colour space that is used for displaying colours on screens)

Format designations

- **.ai (Adobe Illustrator)**
Colour profiles are embedded in AI files. Although this creates larger file sizes, this feature is essential for professional printing with color management.
- **.eps (Encapsulated Postscript)**
EPS files do not include colour profiles. AI files are the preferred file format for professional printing.
- **.psd (native Photoshop Document)**
Pixel-based file format that allows a logo to be retouched in a photograph or illustration, for example.
- **.png (Portable Network Graphic)**
Pixel-based file format that supports transparencies. Used for web, office applications and general screen use.
- **.svg (Scalable Vector Graphics)**
Preferred file format for web and general screen use, when supported by the appropriate software and operating system. When necessary, PNG and JPG files can be used instead of SVG files.
- **.jpg/jpeg (Joint Photographic Experts Group)**
Pixel-based file format for web, office applications and general screen use.
